Atlas AI

Atlas AI

Copy MCP Server

Create and manage industrial AI agents to solve specific business needs using generative AI, language models, and industrial data.

Cognite Atlas AI extends Cognite Data Fusion (CDF) with a workspace to create and manage industrial AI agents that can help solve your specific business needs.

AI agents use generative AI (genAI) **language models** and include prompts with instructions, industry-relevant **tools**, and access to industrial data stored in your CDF **knowledge graph**.

Cognite provides example agent templates that you can use as a starting point for building your agents, or you can use our low-code tools to create agents from scratch.

> Atlas AI features require a separate license from your standard Cognite Data Fusion (CDF) subscription. To enable Atlas AI functionality for your organization, contact your Cognite representative or fill out **this form**.
