Agent tools

Agent tools library

Copy MCP Server

Complete reference of built-in Atlas AI agent tools including query tools, analysis tools, and integration tools for interacting with data and external systems.

Atlas AI agents can interact with tools and functions, allowing them to perform complex tasks and interact with your applications. We provide built-in tools for Atlas AI agents, and you can also define custom tools to extend their capabilities.

Tools enable agents to move beyond simple text generation by providing access to data, computational capabilities, and external systems integration.

Query tools

The query tools use query features to retrieve and explore information from the **Cognite knowledge graph**.

Tool	Use to	Parameters
Query knowledge graph	Retrieve data instances from data models in Cognite Data Fusion (CDF). For high accuracy, configure the tool instructions with additional information on the selected data type.	Specify which **data model**, view, and credentials to use.
Query time series data points	Retrieve data instances for **data points**. Use another tool to identify the relevant time series ID. See also: **Time series in data modeling**.	
Find activities	Retrieve data instances for activities using the generic **Query knowledge graph** tool. The data model is **Cognite core data model**, and the view is set to **Activity**.	Specify which **data model**, view, and credentials to use.

Find equipment	Retrieve data instances for equipment using the generic **Query knowledge graph** tool. The data model is **Cognite core data model**, and the view is set to **Equipment**.	Specify which **data model**, view, and credentials to use.
Find files	Retrieve data instances for files using the generic **Query knowledge graph** tool. The data model is **Cognite core data model**, and the view is set to **Files**. See also: **Files in data modeling**.	Specify which **data model**, view, and credentials to use.
Find maintenance orders	Retrieve data instances for maintenance orders using the generic **Query knowledge graph** tool. The data model is **Cognite process industries data model**, and the view is set to **Maintenance order**.	Specify which **data model**, view, and credentials to use.
Find notifications	Retrieve data instances for notifications using the generic **Query knowledge graph** tool. The data model is **Cognite process industries data model**, and the view is set to **Notifications**.	Specify which **data model**, view, and credentials to use.
Find operations	Retrieve data instances for operations using the generic **Query knowledge graph** tool. The data model is **Cognite process industries data model**, and the view is set to **Operations**.	Specify which **data model**, view, and credentials to use.
Find time series	Retrieve data instances for time series using the generic **Query knowledge graph** tool. The data model is **Cognite core data model**, and the view is set to **Time series**. See also: **Time series in data modeling**.	Specify which **data model**, view, and credentials to use.

Analysis tools

	See also: **Files in data modeling** and **Optimizing data models for AI search**.
Summarize documents	Summarize the information in specific **files**. Use in combination with a query tool that retrieves files. See also: **Files in data modeling**.
Analyze time series (**Preview**)	Perform advanced calculations on time series **data points**. Use another tool to identify the relevant time series ID. See also: **Time series in data modeling**.
Examine data semantically (**Preview**)	Analyze the semantic meaning of data from previously executed queries using natural language prompts. Use to extract insights, identify patterns, or find specific information within query results. This tool analyzes up to 500 instances with a maximum of 150,000 tokens per request. **Note**: Requires **agent runtime version 2.0.0-alpha** or higher.

Integration tools

The integration tools enable Atlas AI agents to interact with external systems and services.

> ⚠ **Beta:** The integration tools are currently in **beta** testing and are subject to change.

Tool	Use to	Parameters
Call REST API	Call a **Cognite API** endpoint.	Specify the API endpoint to call and the method to use.

	run custom Python code.	and the schema of arguments to pass.
