Industrial tools

Canvas

Copy MCP Server

Create and use canvas to analyze and investigate industrial data visually.

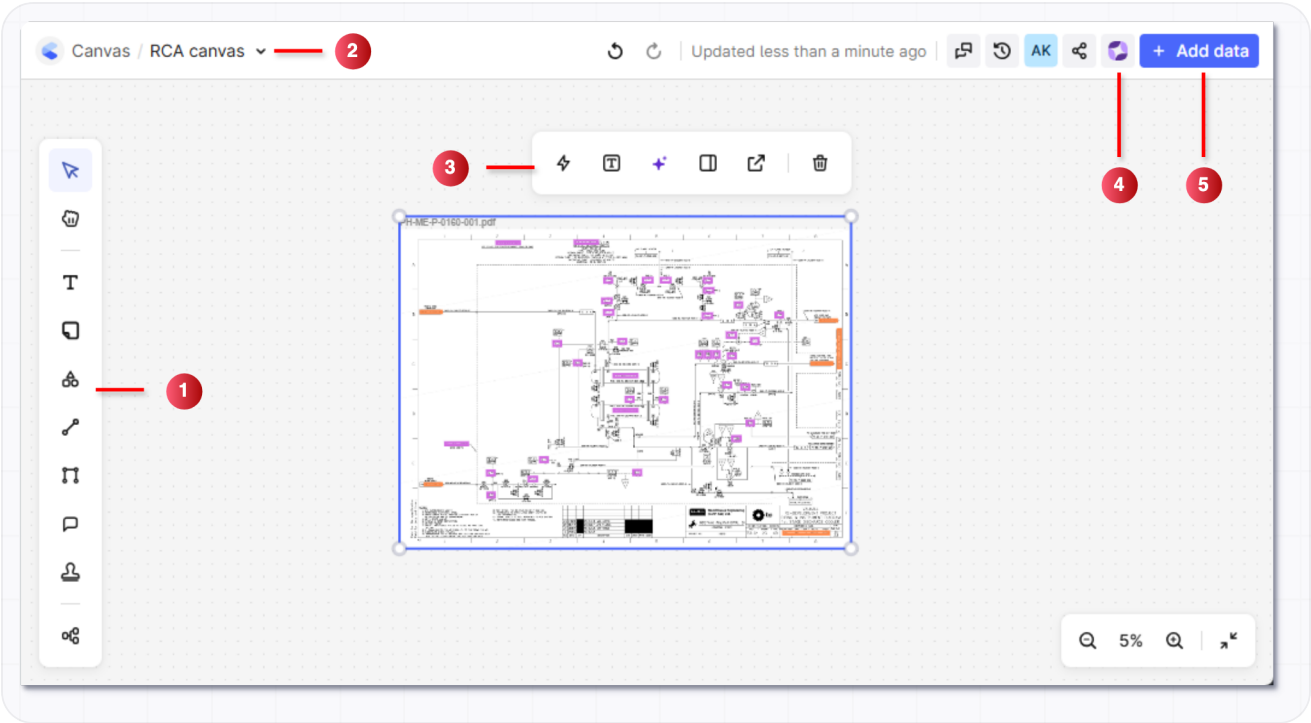
Create a canvas

1 **Navigate to Canvas**

Navigate to **Industrial tools** > **Canvas**.

2 **Create a new canvas**

Select **+ Create canvas** to start a new canvas.

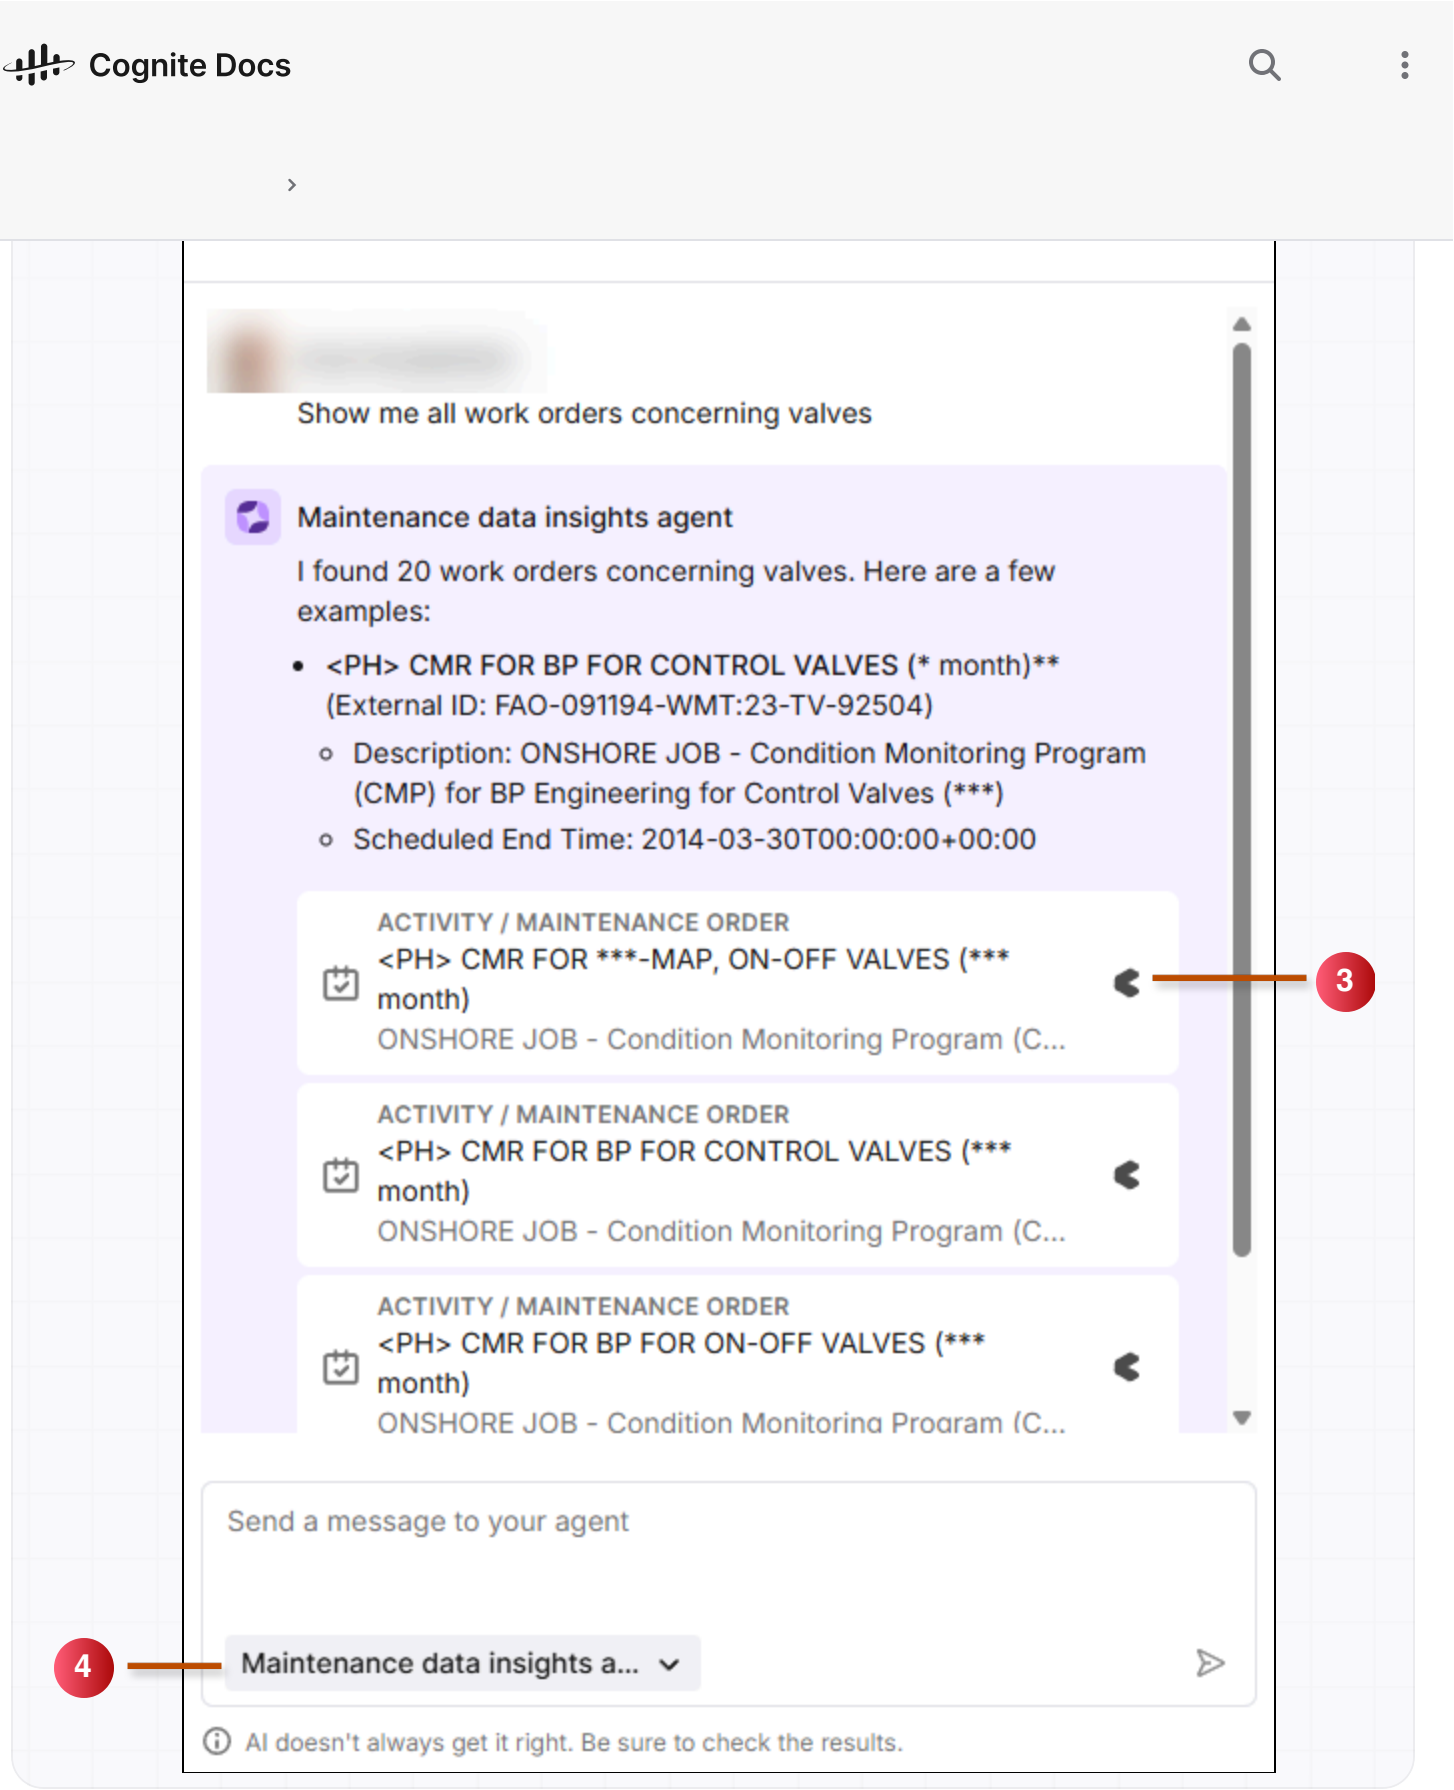


③ **Menubar** — select an item on the canvas to show **relevant options** for the item, for example, **Explore with AI**.

④ **Agents** — open an **AI agent** to work with the canvas.

⑤ **Add data** — find and **select data** to add to the canvas. You can also **drag and drop** local files and images directly to the canvas.

Use an agent to find data



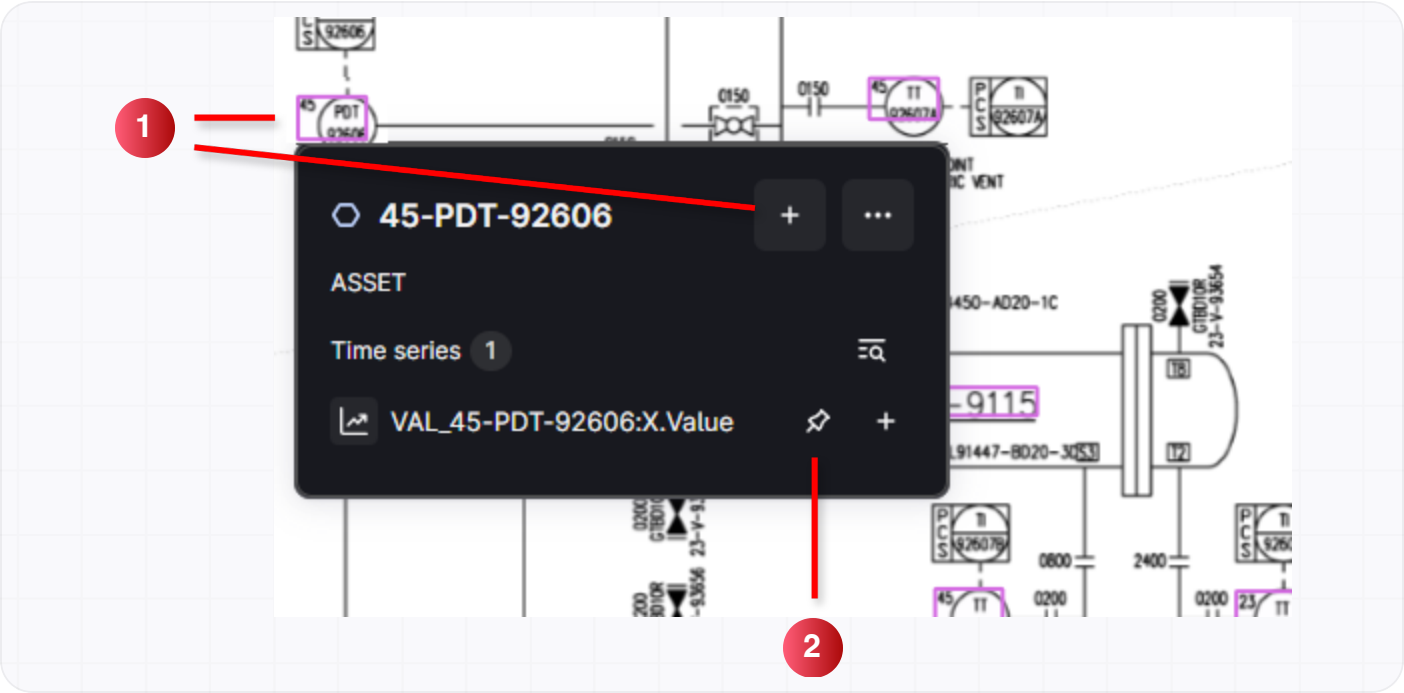
① **New session** — start a new conversation with an agent.

④ **Select agent** — select the agent you want to start a conversation with.

> To interact with an agent, you need these **capabilities**.
>
> Learn more about **Atlas AI**.

Engineering diagrams

Add engineering diagrams and related data to a canvas.



① **Add related data** — click a purple or orange link and the plus sign (+) to add related data, such as engineering diagrams, files, and time series.

② **View live time series data** — pin a time series to the canvas, set threshold values, and use colors to visualize any breaches.

- To **move** items, select and drag.
- To **zoom**, use the mouse scroll wheel, or pinch and stretch on a touchpad.

Work with PDF files

When you add a PDF file to a canvas, you can view it directly, extract individual pages for comparison, and download the canvas or specific pages as a PDF.

Extract pages

Extracting pages lets you view multiple pages side by side for comparison or analysis.

1. **Select a file**

   Select a file and, on the toolbar, select **Extract pages**.

2. **Select pages**

   Select all pages, specific pages, or a range of pages to place them on the canvas.

   Extract pages doesn't create a new file. Each extracted page is a view of the original file focused on a specific page. You can use the page controls to navigate to other pages from any extracted view.

For example, if you extract pages 3-6 from a 10-page PDF, you get 4 additional views of the original file, each focused on a specific page from 3 to 6. If you extract all 10 pages, you get 10 additional views next to the original file.

name > **Download as PDF**, select the containers and files to include, and select **Download**.

By default, all containers and files on the canvas are selected. Clear the checkboxes for any items you don't want to include. You can also reorder the pages before downloading.

Download a file

Download an individual file directly from the toolbar. Select the file and then select **Find related data** > **Download**.

Download specific pages from a PDF

If you only need certain pages from a PDF file, select the canvas name > **Download as PDF**, select the checkbox next to the file, and select **Multiple pages**. Switch to **Selection**, specify the pages you need, and select **Download**.

Supported file formats

Drag and drop these files on to a canvas.
